Calculation of U-value

for OH Sandwich Panels

Carried out for:

O.H. Industri A/S
Smedevej 17
7430 Ikast

Att. Henrik Rytter

Carried out by M.Sc. Bent Lund Nielsen

Aarhus, 18 April 2017

Order no.: 0108/753016

*The result of this report may only be reproduced in its entirety.
This report may only be extracted if the Danish Technological Institute
has approved the extract.*

As agreed, the Danish Technological Institute, Building Technology has performed calculations of the U-value for vertical (90°) OH sandwich Panels. The panels are used in doors and windows.

Basis

- Table from OH showing all the different panels to be calculated.
- Stated design values for the thermal conductivity of the materials used in the panels (if available values from EN 10077-2 are used).
- Plan drawing of raised and fielded panel edge (see Appendix 1). The U-value is calculated on a 1m x 1m panel as required from OH.
- The calculation has been carried out in accordance with EN ISO 10077-2.

Calculations

Design values for the thermal conductivity:

| Material | Thermal conductivity λ_p (W/mK) |
|--|---|
| Extruded Polystyren (iso) \leq 60 mm | 0.034 |
| Extruded Polystyren (iso) $>$ 60 mm | 0.036 |
| HDF | 0.13 |
| Chenchen | 0.13 |
| Mahogany | 0.13 |
| Pine | 0.13 |
| Oak | 0.18 |
| Aluminium | 160 |
| Compact laminate | 0.25 |

$$U_{panel} = 1 / (R_{se} + d_{pe}/\lambda_{pe} + d_{iso}/\lambda_{iso} + d_{pi}/\lambda_{pi} + R_{si})$$

For raised and fielded panels a linear thermal transmittance is calculated from THERM calculations (see example in Appendix 1) and the Up value is then calculated using the formula

$$A_p = A' = 1m \times 1m \text{ (thermal transmission area)}$$

$$U_{panel} = \frac{U_{p,flush} \times A_p + \Psi \times \ell_\Psi}{A'}$$

Results

The results of the calculations can be found in the attached tables in Appendix 1.
